Session 2 //

Wednesday, 6 September @ 11:30 SAST

We will present details of our 10 year monitoring programme of the Be counterparts of Galactic and Magellanic massive X-ray binaries. The long baseline of these observations, along with good cadence, resolution & S/N make this one of the best available optical spectroscopic datasets in the field, and a valuable resource for observers and theoreticians alike. We will discuss some of the science that our team is doing with this data, before the full catalogue is released to the community.
